Modern authentication for the Department of the Air Force
MFA evolution across the Department of Defense

Using the Common Access Card (CAC) for authentication is not practical or possible for every U.S. Air Force Airman, Guardian, employee, contractor and mission partner. Guidance such as the National Security Memorandum/NSM-8, and more importantly, cyber attacks from nation-states to criminal organizations has mandated the DoD to deploy phishing-resistant authentication as part of a Zero Trust Architecture and created requirements to modernize authentication across the entire Department of Defense (DoD).

While CAC meets the highest assurance of multi-factor authentication (MFA) when using DoD Public Key Infrastructure (PKI), there are a growing number of scenarios that have the same assurance requirements where CAC is not available or practical. These scenarios include secure access for telework, BYOAD (Bring Your Own Approved Devices), non-CAC eligible coalition and mission partner environments, air-gapped/isolated networks, shared devices and tactical scenarios overseas where relying on a CAC may inadvertently reveal identities. For example, CAC reader support for mobile phones or tablets is limited or non-existent, and teleworking with a CAC reader leaves the device open to potential malware.

There is a growing need for cost-effective, turnkey solutions to address the needs of today and future-proof against the authentication needs of tomorrow— including those currently under DoD policy review such as Fast Identity Online (FIDO) authentication standards.

Not all MFA is created equal

For those use cases where the CAC is limited or not practical, falling back on username and passwords or legacy MFA is risky. Usernames and passwords are easily hacked, and legacy mobile-based authentication such as OTP, SMS and push notification apps are not phishing resistant. Accounts using MFA that are not based on phishing-resistant protocols are susceptible to having credentials stolen.

The draft National Institute of Standards and Technology (NIST) Digital Identity Guidelines (SP 800-63-4), designed to guide agencies with digital identity assurance and authentication, outlines the technical requirements for phishing-resistant authentication, recognizing two methods as being phishing-resistant: channel binding such as using a PKI-based Smart Card and verifier name binding such as using a Fast Identity Online (FIDO)-based credential and authenticator.

What is Fast Identity Online (FIDO)? FIDO2 is an open authentication standard, created by the FIDO Alliance, that consists of the W3C Web Authentication specification (WebAuthn API), and the Client to Authentication Protocol (CTAP). CTAP is an application layer protocol used for communication between a client (browser) or a platform (operating system) with an external authenticator such as a hardware security key. FIDO2 authentication options include strong single factor (passwordless), two-factor, and multi-factor authentication. Yubico is a core contributor to the FIDO2 open authentication protocol.
The YubiKey offers FIPS-validated phishing-resistant MFA

Yubico offers the phishing-resistant FIPS 140-2 validated YubiKey, a DoD-approved hardware security key that offers highest-assurance multi-factor and passwordless authentication in accordance with Homeland Security Presidential Directive 12 (HSPD 12). The YubiKey is approved for use as an MFA authenticator for DoD Unclassified and Secret information systems that can meet use cases where the CAC is not available nor practical, by leveraging derived CAC credentials. The DoD OCIO Memo on Mobile Public Key Infrastructure (PKI) Credentials, 19 December 2019, approved the YubiKey as a mobile authenticator for issuance of DoD Mobile PKI credentials.

The YubiKey supports derived credentials and provides the highest levels of security needed to protect against modern day attacks along with the flexibility to secure even the most complex scenarios—from air-gapped networks to remote work and cloud services—all from a single key. With multi-protocol support including Smart Card (CAC), FIDO U2F, FIDO2, OTP and OpenPGP, the YubiKey supports both legacy and modern architectures with a single solution, and offers a future-proofed bridge to modern FIDO authentication standards.

If there is truly an urgency to innovate within the Defense Department, adopting tools such as YubiKeys should be made a priority to accelerate zero trust security, improve connectivity, and reduce cyber risk across the Joint Force.”

Jeff Burkett | Major General, USAF (Ret)

The quote expressed herein are solely those of the individual and do not necessarily represent the views of the Department of Defense.
Securing non CAC-eligible users

Non-CAC eligible personnel such as dependents, Nonappropriated Funds employees and other users that require 3rd party access still require secure access to Department of Air Force (DAF) systems. To meet these needs, the DoD approved the YubiKey as one of three alternate MFA solutions when PKI is infeasible—a FIPS 140-2 validated alternative to the CAC that allows non-CAC personnel or personal non-GFE devices in a BYOD environment to securely authenticate to DoD networks.

Securing SCIFs & air-gapped networks

Air-gapped networks are closed off from the outside, making it difficult to authenticate users using data sent over a network. Many air-gapped systems still use a username and password or a combination of passwords and a digital identity. YubiKeys ensure that air-gapped networks stay secured against breaches by providing phishing-resistant MFA that works well in isolated network and mobile restricted environments as they don’t need any network connectivity, cellular connection, or batteries to work. YubiKeys are compatible with Cross Domain Solution (CDS) and Multi-Level Security (MLS), and users can be authenticated without transfer of information.
Securing mission partners

Coalition and “Five Eyes” (FVEY) mission partners use PKI credentials to authenticate to DoD systems, but mission partners are not always CAC-eligible. YubiKey is a solution that the DAF can uniquely manage at the unit level to support access to the data needed to conduct missions, support strong and phishing resistant authentication for mission partners at the tactical edge.

A YubiKey, as a multi-protocol authenticator, provides flexibility and personalization to coalition networks that require DoD credentials for mission partners. Coalition networks can generate and manage local credentials, provision them to a YubiKey, and issue them to mission partners requiring access to DoD resources within a respective Area of Responsibility. This will ensure that only locally issued credentials can be used for authentication within the respective Combatant Command network. Additionally, options are available for the type of managed credentials—tactical PKI supports certificate-based credentials while other Identity Credential and Access Management (ICAM) components can issue FIDO2 credentials. Both types of credentials meet phishing-resistant authentication requirements.
Securing privileged users

Ensuring secure, phishing-resistant user access to classified, secret and personal information is critical for those privileged users that cannot use the CAC to authenticate. The YubiKey offers the highest-assurance alternate authentication that can be used to authenticate privileged users to both legacy and modern applications. The YubiKey’s hardware design enables the authentication secret to be stored on a secure hardware chip that cannot be copied or exported, offering the highest security for authenticating privileged users. The YubiKey can be used for step-up authentication for high-security applications.

DoD Microsoft 365 tenant admins cannot use their primary DoD credentials to authenticate for daily tasks and maintenance. Microsoft Azure supports the enrollment of a YubiKey as a FIDO2 authenticator. Consequently, admins are able to quickly enroll a YubiKey for their privileged user roles to meet phishing-resistant authentication requirements. A YubiKey as a FIDO2 token, uses public/private key pairs bound to the tenant URL, to ensure strong authentication is met.
Securing office workers

Desktop Anywhere is a secure virtual machine that can be accessed from any commercial Internet connection. This capability provides a consistent desktop experience for government civilians and servicemembers, whether physically in the office or working remote. The YubiKey supports this amazing capability by delivering registered participants a simple authentication experience no matter the device used to start the remote session.

Securing telework & BYOAD

Supporting teleworkers and BYOD using the CAC creates complexity. While password-based authentication may simplify remote access, relying on single-factor authentication does not satisfy zero trust security and phishing-resistant authentication requirements.

Fortunately, YubiKey works with leading Identity and Access Management (IAM) and Identity Provider (IdP) solutions to enable phishing-resistant access for remote and hybrid employees without the need for supporting devices. For Guardians, Active, Reserve, and National Guard Airmen, this offers reliable, flexible, and trusted access to DAF resources using Purebred derived certificates. Enabling capabilities, such as Desktop Anywhere that make it easier for service members to access services from home, no longer need to be reliant on a CAC and a separate CAC reader. In cases where remote and hybrid workers are sent GFE devices, the YubiKey can also be used as a portable root of trust to ensure the device hasn’t been compromised enroute.

YubiKeys have the flexibility to be used with a wide range of mobile devices and unmanaged and managed workstations, including Chromebooks and personal phones. When a YubiKey has been provisioned with DoD Purebred credentials, it becomes a portable root of trust for service members’ identities, making it easier to authenticate regardless of the device.

From February 2020 to June 2021, through a NIST grant administered by Yubico, the State of New York Division of Military and Naval Affairs (DMNA) enhanced cyber security for its Disaster Local Area Network web-based application by establishing remote identity proofing using ID.me and YubiKeys for multi-factor authentication (MFA). As a progression to the grant project, the Air National Guard piloted YubiKeys with Defense Information Systems Agency Purebred derived credentials with a mobile app on personal devices for 1,000 Airmen at 13 ANG units with remotely piloted aircraft missions. Within 17 months, the project implemented the new YubiEnterprise Delivery (YED) supply chain management and ordering software, proved out, and educated and trained New York National Guard staff on identity, credential and access management.

From August through October 2023, in collaboration with the Air Force Reserve Command’s (AFRC/A4) proof of concept, Yubico trained 28 Purebred agents at 35 Air Force Reserve units implementing shared iPads within Fire Rescue, Maintenance (eTools, aircraft maintenance technical orders) and Mission Support Groups (Civil Engineering, GeoBase).

Due to the unit-level management of YubiKeys, personnel are less dependent on help desk support for assistance with PIN Unlock Key issues.

The YubiKey will provide our military workforce with a secure tool that provides access to essential information from any device. The simplicity, security, and size makes the YubiKey a valuable component of the mission anywhere and anytime.”

Mike Kingsley | Major General, USAF (Ret)

Securing shared devices & workstations

Airmen, Guardians, DoD civilians and contractors that use shared workstations and shared devices such as Electronic Flight Bags (EFBs) and eTools iPads, can benefit from using the YubiKey as a portable root of trust for secure authentication. They can authenticate to the network using the trusted Smart Card credential on their YubiKey, proving they are a trusted user.

A single YubiKey works across multiple shared devices including desktops, laptops, mobile, tablets, and notebooks, enabling users to utilize the same key as they navigate across devices. YubiKeys are also easily re-programmed, making them suitable for rotating-shift and temporary users across these environments.

The use of shared workstations and mobile devices are increasingly common across the DAF. By affording a pool of resources for maintainers and aircrew, the DAF can lower the total cost of ownership of devices. However, shared devices still have the challenge of supporting multiple users, each requiring DoD credentials for authentication. By shifting the storage of the credentials from the device to a hardware-based authenticator, like a YubiKey, each individual can be issued a security key for authentication on any of the shared devices. Users do not have to worry about grabbing the right devices matching their stored soft credentials.
Ready to get started?

When you choose YubiKeys as a service, you make decisions as you go with our insight and help, simplifying the process of scaling YubiKeys to wider circles of use cases and leveraging the insight from over 150 U.S. government implementations to date.

We have created a six step deployment process to plan for and accelerate adoption of phishing-resistant MFA at scale

Agencies can obtain Not for Resale (NFR) YubiKeys for proof of concept (POC) programs. Yubico also offers solutions engineering support for architecture design and review, and IDP configuration guidance through the POC.

Once ready to purchase, Yubico is focused on helping agencies easily access security products and services in a flexible and cost-effective way to heighten security:

- **Plan**: Ensure readiness by clarifying use cases and user populations
- **Validate**: Confirm the process with a small group of users before broader rollout
- **Integrate**: Ensure key apps and services are YubiKey-ready
- **Launch**: Distribute keys to users with turnkey delivery services or channel partners
- **Adopt**: Drive adoption with best practice training and support
- **Measure**: Report on security and business value impact

Agencies can purchase YubiKeys via a one-time perpetual purchasing model or can opt for greater flexibility with a subscription model.

With **YubiEnterprise Subscription**, agencies receive a service-based and affordable model for purchasing YubiKeys in a way that meets their technology and budget requirements. This service also provides priority customer support, ease of form factor selection, backup key discounts, and replacement stock benefits.

Yubico’s **Professional Services** team can help you with a successful implementation. Yubico offers a wide variety of advisory services in support of your YubiKey implementation and deployment, including best practices workshops, technical implementation packages, on-demand consulting resources and custom engagements. Our Professional Services team is comprised of trained and accredited security professionals with experience gained from hundreds of customer implementations across a wide range of industries and the government sectors. From standard implementations to complex enterprise rollouts, Professional Services has the skills and expertise to help guide you through all facets of your YubiKey implementation and deployment.
Yubico (Nasdaq First North Growth Market Stockholm: YUBICO) is the inventor of the YubiKey, a hardware security key that is the gold standard in phishing-resistant multi-factor authentication (MFA). Yubico’s solutions offer organizations and users deployment expertise and operational flexibility as YubiKeys work across hundreds of consumer and enterprise applications and services.

Yubico is a creator and core contributor to the FIDO2/passkey, WebAuthn, and FIDO Universal 2nd Factor (U2F) open authentication standards, and is a pioneer in delivering modern, hardware-based passkey authentication security at scale to customers in over 160 countries. For more information, please visit: www.yubico.com.
